DOCUMENT-IDENTIFIER: US 6154757 A
TITLE: Electronic text reading environment enhancement method and apparatus

BSPR:
Despite the advent of the electronic age, the preferred method of reading today
is by far to read a text printed on paper, or hard copy, even though electronic
versions of the same text are available at lower cost. Indeed, rather than
moving to a paperless society as once envisioned, the electronic age has
resulted in the use--and waste--of even more paper than before, as word
processors and laser printers generate more and more drafts of the same
document, and printing information of all kinds from the Internet can be
accomplished with a single mouseclick.

BSPR:
Another object of the present invention is to provide the ability to display
text from multiple different sources in accordance with the reader's
preferences. These include, but are not limited to, texts obtained by scanning
a paper text into an electronic text, texts obtained by downloading from the
Internet, texts on CD-ROM or other computer storage devices, and texts in other
computer programs which include display of text as a part of their
functionality.

BSPR:
Another object of the present invention is to facilitate reading or skimming of
textual material gathered by an "agent" program from the Internet or other
types of networks while the user is not present.

DEPR:
A computer system as may implement and execute the present invention is
described with reference to FIG. 1. Such a computer system generally may

comprise a processing means (102), such as a central processing
unit (CPU), for
processing information; a memory (104) for storing information
and instructions
for the processor, preferably including a dynamic storage means
(such as random
access memory (RAM)) and a static storage means (such as
read-only memory
(ROM)); a data storage device (108) such as a magnetic disk and
disk drive for
storing information and instructions; a control means (106) for
controlling
input/output operations and the interaction between the processor
(102) and the
memory; a display device (110) such as a cathode ray tube,
projector, or liquid
crystal display for displaying a cursor and information to the
computer user;
an alphanumeric input device (112), such as a keyboard, including
alphanumeric
and other keys for communicating information and command
selections to the
processor (102); and a cursor control device (128), such as a
point-and-click
mouse device, trackball, joystick, or light pen, for
communicating information
and command selections to the processor (102) and for controlling
cursor
movement. Other input devices including microphones (118),
scanners (124),
video, touch sensitivity and galvanic skin response sensors may
also be used.
The system may also include computer hardware and loudspeakers or
headphones
appropriate for generating audio output (120). It is useful if
the system
includes a hardcopy device (114), such as a printer, for
providing permanent
copies of information. Finally, the system may include a modem
(116) for
communicating with computer systems at remote locations, or a
connection to a
server for communicating with computer networks (122) including
the Internet.

DEPR:
"Select Reference works" 4701 permits the user to provide the
program the names
and locations of files containing reference works to be accessed
by the
program. Such files may include dictionaries, thesauruses,

encyclopedias,
casebooks, treatises, or any other text. Such files may either be resident on
the user's computer, or may be accessible through computer networks or the
internet. In the special case of references associated with a concordance
created by the user using the "Preread" (create concordance) option, this
information may already have been provided, and is already preset to the
appropriate wordlist.

DEPR:
FIG. 10 illustrates an annotation input dialog box, which permits the user to
specify an annotation type and to type in material comprising the annotation.
Sections of the text may be included in this annotation by selecting them with
a point and click device prior to accessing this dialog box. The user may
include text or proofreader's marks in this written annotation. The text box
may be left empty, providing a "bookmark" to the location in the text from
which the annotation was created, which may be accessed using a pulldown menu
list of annotations defined on the text. The program also has the capability
of saving audio annotations in a similar manner. This example shows how the
annotation displayed in FIGS. 10, 11 and 13 was entered into the program.
